DESCRIPTION

The HYM7V75A800A/ 75A801A/ 75A830A/ 75A831A F-Series are high speed 3.3-Volt synchronous dynamic RAM Modules composed of nine 8Mx8 bit Synchronous DRAMs in 54-pin TSOPII and 8-pin TSSOP 2K bit E²PROM on a 168-pin glass-epoxy printed circuit board. A 0.33 μ F and 0.1 μ F decoupling capacitors per each SDRAM are mounted on the module.

The HYM7V75A800A/ 75A801A/ 75A830A/ 75A831A F-Series are gold plated socket type Dual In-line Memory Modules suitable for easy interchange and addition of 64M bytes memory. All addresses, data and control inputs are latched on the rising edge of the master clock input. The data paths are internally pipelined to achieve very high bandwidths.

2. If clock rising time is longer than 1ns, $(t_r/2-0.5)$ ns should be added to the parameter.

(V=Valid, X=Don't care, H=Logic High, L=Logic Low)

Note: 1. OP code : Operand Code. ADDR, A10/AP, BA : Program keys (@MRS)

2. MRS can be issued only at both banks precharge state.

A new command can be issued after 2CLK cycles of MRS.

3. Auto refresh functions are as same as CBR refresh of DRAM

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at both banks precharge state.

4. BA : Bank select address.

If "Low" at read, write, row active and precharge, Bank A is selected.

If "High" at read, write, row active and precharge, Bank B is selected.

If A10/AP is "High" at row precharge, BA is ignored and both banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at TRP after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at positive going edge of a CLK masks the data-in at the very CLK (write DQM

Latency is 0), but makes Hi-Z state the data-out of 2CLK cycles after. (Read DQM latency is 2)
