DESCRIPTION:

The IDT29FCT2052T is an 8-bit registered transceiver built using an advanced dual metal CMOS technology. Two 8-bit back-to-back registers store data flowing in both directions between two bidirectional buses. Separate clock, clock enable and 3-state output enable signals are provided for each register. Both A outputs and B outputs are guaranteed to sink 64mA.

The IDT29FCT2052T has balanced drive outputs with current limiting resistors. This offers low ground bounce, minimal undershoot and controlled output fall times-reducing the need for external series terminating resistors. The IDT29FCT2052T is a plug-in replacement for the IDT29FCT52T.

PIN DESCRIPTION

Name	I/O	Description
A_{0-7}	I/O	Eight bidirectional lines carrying the A Register inputs or B Register outputs.
B_{0-7}	I/O	Eight bidirectional lines carrying the B Register inputs or A Register outputs.
CPA	I	Clock for the A Register. When $\overline{CEA}$ is LOW, data is entered into the A Register on the LOW-to-HIGH transition of the CPA signal.
$\overline{CEA}$	I	Clock Enable for the A Register. When $\overline{CEA}$ is LOW, data is entered into the A Register on the LOW-to-HIGH transition of the CPA signal. When $\overline{CEA}$ is HIGH, the A Register holds its contents, regardless of CPA signal transitions.
$\overline{OEB}$	I	Output Enable for the A Register. When $\overline{OEB}$ is LOW, the A Register outputs are enabled onto the B_{0-7} lines. When $\overline{OEB}$ is HIGH, the B_{0-7} outputs are in the high-impedance state.
CPB	I	Clock for the B Register. When $\overline{CEB}$ is LOW, data is entered into the B Register on the LOW-to-HIGH transition of the CPB signal.
$\overline{CEB}$	I	Clock Enable for the B Register. When $\overline{CEB}$ is LOW, data is entered into the B Register on the LOW-to-HIGH transition of the CPB signal. When $\overline{CEB}$ is HIGH, the B Register holds its contents, regardless of CPB signal transitions.
$\overline{OEA}$	I	Output Enable for the B Register. When $\overline{OEA}$ is LOW, the B Register outputs are enabled onto the A_{0-7} lines. When $\overline{OEA}$ is HIGH, the A_{0-7} outputs are in the high-impedance state.
